

Adding dynamic EFTPOS capabilities to Point Of Sale

POSgate is a simple and flexible Point Of Sale middleware. It is supported by a suite of business solutions for integration into Point of Sale systems and it supports Ingenico Telium 2 and Tetra hardware range.

POSgate provides access to a set of business tools and Value Added Applications. It is complemented by a Business Reporting platform which provides a view of transactions including cash, vouchers and Business Intelligence reports.

- A single POS interface for all merchant environments, fixed or mobile with no reliance on in-store servers
- Integrates seamlessly with existing merchant software solutions to create a smooth payments process
- A supported interface throughout Asia Pacific, adapted by multiple integrators and acquirers across many popular operating systems
- Supports integration of Value Added services at the POS

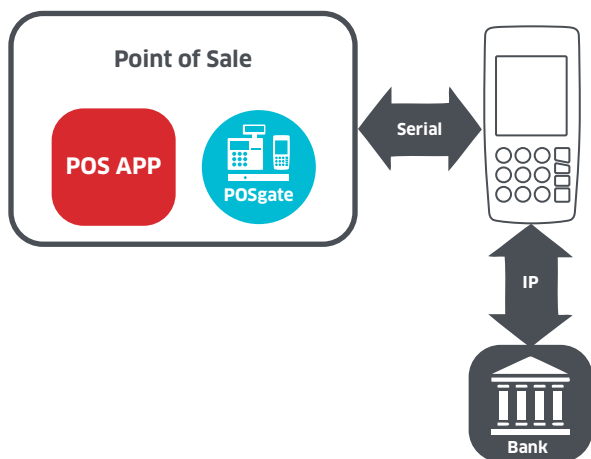

Using Serial / USB

Many countertop POS systems support either serial or USB as a standard connection option for peripheral devices, such as PINpads. It is also possible to power the PINpad using a USB port. Where the POS is unable to provide power, Ingenico can provide a cable with a power injector.

In this configuration, the PINpad will send all payment messages from the PINpad to POSgate for delivery to the bank via the POS system's LAN connection.

Using Serial / USB & IP to the Bank

Where the point of sale has a serial connection to the POS and is unable to handle the communications to the bank to process the payment, the PINpad can have an independent connection via Ethernet, wifi or 3G/4G to the bank for transaction delivery.
