

Environmental Charter

As a global leader in the payment industry with international footprint, Ingenico Group has a key role to play in reducing the environmental impact of the payment chain.

Given our core business, we help to further the development of payment solutions that have less impact on the environment than traditional means of payment such as cash or checks. Nevertheless, we inevitably have environmental impacts that we strive to control.

We fully accept our responsibility to protect the planet, including pollution prevention in all our business activities by adopting best practices and developing lower impact solutions.

Environment is one of the four pillars of **SHARE**, our global programme for Corporate Social Responsibility.

To manage our environmental impacts in the most responsible way and control our footprint, we commit to:

1. Develop the eco-design of our products and services

Our eco-design approach is part of an overall approach that considers the entire lifecycle of our products and services from a circular economy perspective. It consists of incorporating environmental concerns right from the very early stages in the design of payment solutions to save and recycle natural resources as much as possible.

2. Favor the deployment of low environmental impact solutions

We commit to develop innovative solutions and features that minimize the environmental footprint of payment transactions. As an example, paperless receipt management is a real opportunity to enrich customer experience with a lighter environmental footprint.

3. Minimize the carbon footprint of our operations

We strive to reduce the greenhouse gas emissions induced by the operations of our infrastructures and our activities by implementing sustainable initiatives such as the use of renewable energy in our offices and data centers for the processing of payment transactions.

4. Facilitate the recycling of electronic waste

As a global manufacturer of electronic products, we notably support our customers in the recycling of their end-of-life products in a more responsible manner. The recycling of electronic waste resulting from the products we sell is a commitment to circular economy helping to reduce pollution and save natural resources.

I will make sure we will have the necessary means to deploy this approach within the entire Ingenico Group. Each one of us is required, as part of our daily activities, to make it live.

Nicolas Huss
