

# Estate Manager

## The cost-effective and seamless centralized remote terminal estate management solution

- Guarantee full and constant compliance with the latest regulations.
- Control and monitor your terminal fleet of terminals remotely with a single centralized solution.
- Ensure fast and efficient deployment campaign for any terminal content including: OS, application, parameters, security keys, advertising, promotion.
- Cut costs and shorten deployment lead time with optimized services such as on-the-spot terminals' auto initialization.
- Leverage complete statistics dashboards to optimize merchant services.

Ingenico Group makes estate management easy by providing a single central solution adapted to all types of fleets, whatever their size and terminal configurations.

**All Contents, All Terminals, All Geographies**

Our solution ensures efficient and reliable updating of all software elements on terminals; this applies to Telium OS (Telium 2, Telium TETRA and Android), applications, application parameters, multimedia content, banking keys. This capability applies to the entire Ingenico Group product line regardless of the communication mode or network the solutions are configured for. It also supports the delivery of application parameters to "EPAS-TMS" compliant terminals.

**No Business Disruption**

Ingenico Group protocols guarantee continuity of service during the update procedure. In case of update failure due to telecom connection cuts, terminals will continue to work on their previous configurations. Additionally, our helpdesk enables technicians to remotely manage, diagnose, and repair terminals to keep them running smoothly.

**Total Cost of Ownership (TCO) Reduction**

With all interactions managed online, there is no need to ship terminals to a repair center. Each device is remotely monitored via a "heartbeat" which continuously informs the estate manager of its health/ connection status, usage statistics and diagnostic information, enabling improved preventative maintenance. This cuts local administration and maintenance costs, keeping the overall cost of ownership to a minimum.

**Terminal Auto-Initialization**

After deployment in the field, Ingenico Group terminals are configured remotely according to merchants' chosen parameters. The whole installation process is carried out by remote download. Installation and initialization are complete once terminals are connected to the bank and to Ingenico Group centralized estate management server.

**Multimedia**

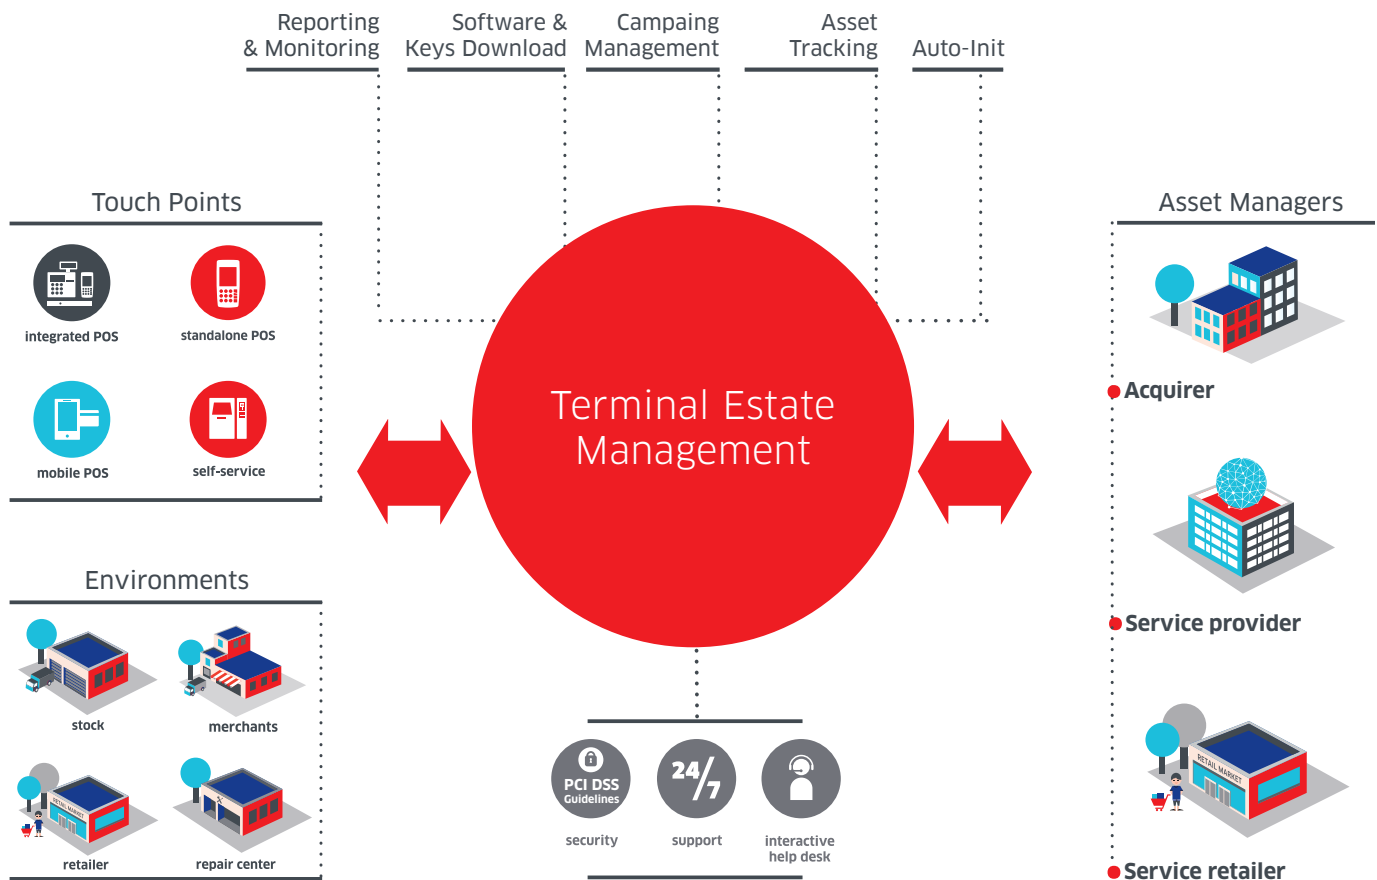

Our multimedia campaign management system is designed to cover all merchants's daily needs. Asset managers can readily access reporting tools and check the status of each campaign. Thanks to real time alerts, they can identify missing or faulty devices quickly- reducing risk and allowing them to re-schedule campaigns.

**Customizable Reporting Dashboard**

Through the Ingenico Group reporting interface, asset managers follow up on their activities with customizable dashboards. These reports can be predefined and scheduled according to the analyst's needs. They can also be exported into the acquirer's information system.

**Convenient & Secured Remote Key Injection**

With remote access, key injection is managed through Ingenico Group Estate Manager during the terminal's entire lifetime. The key distribution between the T-GKIT's key safe and the secure area of the terminal is secured by Ingenico Group's Public Key Infrastructure.
